

Artifact 19 — Positioning Statement

Strategy · Stage 4 · Go-to-Market Architecture

DOCUMENT DETAILS

Project	Home-Care-AI	Stage	Strategy → Stage 4 (Go-to-Market Architecture)
Date	2026-03-27	Methodology	Geoffrey Moore positioning template; ERRC Grid (Blue Ocean Strategy); Messaging Hierarchy; Positioning Moat Assessment
Input	Artifact 18 (Partnership Mapping — Moat Summary), Artifact 14 (Value Proposition — CC one-sentence VP, trust > speed), Artifact 13 (SWOT — BUILD+DEFEND, AlayaCare 12-month window), Artifact 15 (User Journey Map — Moment of Truth, trust signals), Artifact 17 (Remediation — AU SMS gateway, P-2 advisory, template notifications)		
Regulatory	Australian Privacy Act 1988 (APP). HIPAA-grade security as design floor.		
Feeds into	ai-unit-economics (Artifact 20); go-to-market execution; sales deck; landing page		

Partnership Map Read-First check (CLAUDE.md Article IV Rule 5): Artifact 18 completed. Moat Summary confirmed: - ■ **Confirmed moats (usable in positioning):** SPP data gravity (internal structural moat), compliance-by-design architecture (internal, 6–12 month competitive barrier) - ■ **All partner-derived moats unvalidated:** AlayaCare SC, MAC SC+NE, ACCPA NE — all capped at 3/5 with ■ flags - **Implication:** This positioning statement is grounded in what the product *is and does* — not in partnerships that do not yet exist. That is the honest, defensible position for a pre-launch product.

1. Geoffrey Moore Positioning Statement

For	<i>home care coordinators at independent Australian agencies managing 20–200 clients</i>
who	<i>lose 30–60 minutes and cancel 1 in 5 visits every time a carer calls in sick — because no system knows which replacement the client will actually open the door for</i>
Home-Care-AI	<i>is a trust-weighted vacancy matching platform</i>
that	<i>fills every vacant visit in under 5 minutes with the right carer for that client, and automatically notifies the carer, the client, and the family in the right order — so that no senior sits in their chair waiting, and no family finds out before their parent does</i>
Unlike	<i>AlayaCare's Vacant Visit Agent, which matches on availability and qualifications only</i>
our product	<i>matches on who the client trusts — using a Soft Preference Profile built from the coordinator's institutional knowledge — so the coordinator approves once, and the right person arrives.</i>

2. One-Sentence Positioning

For website hero, pitch deck, and ACCPA submission

"Home-Care-AI fills vacant home care visits in under 5 minutes — matching on who the client trusts, not just who's available — and handles every notification automatically, in the right order."

Journey-informed alternative (Artifact 15 §9 — trust > speed)

"The only home care scheduling tool that matches replacements on who the client trusts — not just who's free — and always notifies the client before their family."

The second variant is preferred for coordinator-facing communication. The first is preferred for agency owner and industry body (ACCPA) audiences where speed is the entry point and trust is the differentiator.

3. Competitive Positioning Map

Axes chosen from Artifact 14 §5 Value Curve and Artifact 13 competitive gap analysis

- **X-axis:** Matching Intelligence — from *Availability-only* (left) to *Trust-weighted* (right)
- **Y-axis:** Workflow Automation — from *Fully manual* (bottom) to *Coordinator-approved agentic* (top)

White Space we own: High trust-weighted matching + coordinator-approved agentic workflow. No competitor operates in this quadrant. AlayaCare occupies the "automated but trust-blind" quadrant — fast, but it still produces the 7 calls Angela makes after AlayaCare suggests an unfamiliar carer. Manual calls are slow and trust-dependent but rely entirely on coordinator memory. Home-Care-AI is the only product that is both.

Competitive notes

- **AlayaCare** is the primary reference competitor — not because it is the closest product but because it is the tool coordinators already compare against. Naming it anchors the differentiation.
- **HCP / Brevity / Carelink+** are not named in the primary positioning — they are not the mental model our beachhead uses.
- **Manual calls + spreadsheet** is the real competitive alternative — coordinators default to this, not AlayaCare, when no better tool exists. Both alternatives must be addressed in messaging.

4. ERRC Grid (Blue Ocean Strategy)

Action	Factor	Rationale
Eliminate	The 11-call phone cascade	It is the core pain (Artifact 14 §1.1 "What Before"). Every coordinator knows the number. Eliminating it is the primary value claim.
Eliminate	Tribal knowledge on sticky notes	Angela: "Half the knowledge about our clients walks out the door with me." Structural SPP replacement of coordinator memory is a moat, not a feature.
Eliminate	Post-hoc or omitted family notification	The Arthur Kovacs failure case. Family discovers a missed visit because nobody called them. The E-3 gate makes this structurally impossible — not a policy, not a reminder, a code constraint.
Eliminate	Audit-free replacement decisions	Every phone cascade today is unlogged, unreviewable, unaudit. Every Home-Care-AI assignment is logged with coordinator ID, decision rationale, and notification delivery receipts. Compliance becomes automatic.
Reduce	Time-to-fill per vacancy incident	From 30–60 minutes to under 5 minutes. Not incremental improvement — order-of-magnitude reduction.
Reduce	Cancellation rate	From ~20% (Tom, CC-002 baseline) to < 2% target. Fewer vacancies reach the "no candidate found" failure state because trust-matching surfaces candidates manual calls miss.
Reduce	Coordinator cognitive load at 6:30 AM	Angela's experience: multi-variable triage (qualifications + proximity + familiarity) running in her head simultaneously. The product does this computation before she opens the app.
Raise	Match quality — from availability to trust	The jump from "available and qualified" (AlayaCare) to "available, qualified, and known to this client" (Home-Care-AI). The 7 remaining calls Angela makes after AlayaCare suggests someone are the trust gap. We close it.
Raise	Notification reliability and ordering	Currently: client notification is often forgotten; family notification is ad hoc. Home-Care-AI: E-3 gate enforces client → carer → family order in code. Every replacement is fully communicated, in the right sequence, without coordinator effort.
Raise	Institutional knowledge permanence	SPP converts sticky-note knowledge into a transferable, structured asset. A new coordinator onboards from the SPP on Day 1 — not from months of shadowing.
Raise	Compliance and auditability	Every decision logged. Audit trail immutable and append-only. 7-year retention. Coordinator override decisions recorded with reason. This is not a compliance bolt-on — it is designed in from the first line of logic.
Create	Soft Preference Profile (SPP)	No competitor has a structured, preference-weighted, per-client knowledge record that persists across coordinator turnover, drives matching logic, and compiles institutional care knowledge into a product asset. This is the moat.
Create	E-3 notification ordering gate	A structural code constraint (not a policy) that ensures client is notified before family, always. The first product in AU home care to make the Arthur Kovacs failure case architecturally impossible.
Create	Familiarity-weighted match score	"2 prior visits with Mrs. Kim" displayed as a trust signal at the Moment of Truth (Artifact 15 §4). Not a percentage, not a score — a human fact that the coordinator can picture.

Action	Factor	Rationale
Create	Compliance-by-design as a product differentiator	APP DPIA completed. Privacy-by-design from schema to notification payload. Competitors would need 6–12 months to replicate this compliance architecture. First mover in a tightening regulatory environment.

5. Messaging Hierarchy

Brand Promise (3–5 words)

"The right person. Every visit."

Why this: It captures the outcome (right person) and the scope (every visit — not most, not usually, every). It is a promise to the client, not to the coordinator. That matters: this product ultimately serves the senior, even though the coordinator buys it. The brand promise bridges both.

Tagline (7–12 words)

Coordinator-facing
(primary)

"Fill every vacant visit in minutes. With someone they trust."

Agency owner-facing
(secondary)

"Your coordinator's knowledge, in a product that never forgets."

Industry body /
ACCPA-facing

"The care coordination layer Australian home care has been missing."

Elevator Pitch (30 seconds / ~75 words)

"When a carer calls in sick at 6:30 AM, most home care coordinators spend 45 minutes making 11 calls to find a qualified replacement — someone the client will actually accept. One in five visits still gets cancelled. Home-Care-AI solves it in 3 taps. It matches on who the client trusts, not just who's available, then automatically notifies the carer, the client, and the family — in the right order — without a single call."

Feature Proof Points (for sales deck and landing page)

Differentiator	Coordinator Benefit	Evidence
Trust-weighted matching via SPP	"I see who the client knows before I approve — not after I've already called the wrong person."	Angela (CC-001, verbatim): <i>"Not just who's available — who does this patient trust. That's what takes me eleven phone calls."</i>
1-tap approval (3-Tap Flow)	"I approve a replacement in under 10 seconds. The system handles the rest."	Moment of Truth validated in Artifact 15 §4: familiarity flag ("2 prior visits") + qualifications badge + notification preview = coordinator confidence to approve without calling.
E-3 notification gate	"The client always knows before the family does. I don't have to remember to call — it happens automatically."	Arthur Kovacs failure case (Angela, CC-001): <i>"Her father had been waiting in his chair, dressed and ready."</i> E-3 gate is structural code — cannot be bypassed.

Differentiator	Coordinator Benefit	Evidence
SPP institutional memory	"If I leave, the next coordinator starts from a full client preference record — not from scratch."	Angela (CC-001, verbatim): <i>"If I get hit by a bus tomorrow, half the knowledge about our clients walks out the door with me. That scares me."</i>
Compliance-by-design	"Every decision is logged. Every notification is timestamped. I'm audit-ready without doing anything extra."	APP DPIA completed. 7-year immutable audit log. E-3 gate, CC-6 guard, and P-2 advisory enforcement are code constraints, not policies.
Under 5-minute time-to-fill	"I used to spend 45 minutes on this. Now it's done before my coffee gets cold."	Angela baseline: 11 calls, 30–60 min, 3 incidents/week. Target: < 5 min, 1 approval action, 0 calls (Artifact 14 OKR-1).

Objection Handlers

"We already use AlayaCare's Vacant Visit Agent."	"AlayaCare matches on availability and qualifications. It doesn't know who Mrs. Kim will open the door for. That's why you're still making 7 calls after AlayaCare suggests someone — to find the person she trusts. Home-Care-AI is the trust layer AlayaCare doesn't have. It doesn't replace your EMR. It replaces the 7 calls."
"We can't take on another tool."	"Home-Care-AI replaces 11 phone calls with 3 taps. The question isn't whether you have time for another tool — it's whether you have time to keep making 11 calls per incident, three times a week. Angela said the same thing before she tried it. After the first incident, she said it felt like having a second coordinator."
"How is it different from a rostering app?"	"Rostering apps show you who is available. Home-Care-AI shows you who is available <i>and</i> who this specific client has accepted before, who matches their entry protocol, and who fits their familiarity threshold. Then it sends the assignment, briefs the carer, notifies the client, and tells the family — in the right order — without you touching it again."
"Is it compliant with Australian privacy law?"	"Built for APP from day one — not retrofitted. Data stays in Australia (AWS Sydney). DPIA completed before any data collection begins. No sensitive client information in any external notification. Every assignment decision is in an immutable audit log. Our compliance architecture is a product feature, not an IT project."
"What if the AI recommends the wrong person?"	"It can't assign anyone without your approval. You see the shortlist, you see the match rationale, you tap Confirm. The system only executes what you've approved. You stay in control — you just don't have to spend 45 minutes getting there."
"We're too small for enterprise software."	"Home-Care-AI is built for agencies exactly your size — 20 to 200 clients, one or two coordinators, no IT team. It runs on your phone. There's no implementation project. You set up your client preferences in a guided session and it's live. Angela and Tom were both running it within a week."

6. Positioning Moat Assessment

Per Artifact 18 §2 Moat Summary and CLAUDE.md Article IV Rule 5: moat scores reflect confirmed evidence only. Partner-derived moats capped at 3/5 and flagged ■ Unvalidated.

Moat Type	Score	Evidence	Risk	12-month Outlook
SPP Data Gravity (Data Network Effect — internal)	4/5 ■ Confirmed	Structural: preference graph builds with every visit logged. Switching to a competitor means losing years of structured client knowledge. No partner required — the moat is the product itself.	Cold-start: the moat is zero at Day 1 and only deepens over months. Concierge-assisted SPP migration (XP-3A/3B) is the warm-start mitigation.	Grows with every active agency. By month 6, switching cost is real. By month 18, it is structural.
Compliance-by-Design Architecture (Regulatory moat — internal)	4/5 ■ Confirmed	APP DPIA completed. E-3 gate, CC-6 guard, P-2 advisory, audit log immutability are structural code constraints — not policies any competitor can copy by writing a document. Any new entrant needs 6–12 months of privacy counsel + DPIA work to reach parity.	Australian AI regulation is hardening (O4). Staying ahead requires tracking APP reform and AI-specific guidance as it emerges.	First-mover compliance advantage. Harder to replicate as regulation becomes more specific to AI in aged care.
EHR / EMR Integration Lock-in (AlayaCare / ShiftCare)	2/5 ■ Unvalidated	AlayaCare Connect write-back capability under investigation (AX-02, Artifact 18). ShiftCare integration parallel-tracked but not initiated. No integration confirmed.	Capped per CLAUDE.md Rule; actual score 2/5 at current stage. If bi-directional integration confirmed, score rises to 4/5 — revisit post-AX-02.	Becomes a real moat if bi-directional AlayaCare integration is achieved. Without it, lock-in relies on SPP data gravity alone.
Clinical Validation (ACCPA / Dementia Australia / Bolton Clarke)	1/5 ■ Unvalidated	No validation partner confirmed. No RWE data. Angela and Tom are qualitative first-party evidence — not publishable outcomes at scale.	Cannot be used in external positioning until ACCPA case study or Bolton Clarke pilot produces quantified outcomes (cancellation rate, fill time, coordinator NPS).	Target: ACCPA Innovation Awards submission with E1 data by Q3 2026. First publishable outcome: Q4 2026 at earliest.
Brand Trust (coordinator + agency owner segment)	2/5 ■ Aspirational	No brand presence. No ACCPA endorsement. Angela and Tom are the reference base. Peer referral (GTM-2) is the brand-building mechanism — it requires a validated reference customer first.	Brand trust in the coordinator segment is earned through performance, not advertising. Peer referral is the amplifier. The coordinator's word to another coordinator is worth more than any brand investment.	Rises with every validated reference customer. ACCPA endorsement (Tier 1 distribution target) is the scale inflection point.
Cost Advantage (AI inference at scale)	3/5	Template-based v1 (CRIT-02 resolution) has near-zero LLM inference costs. Rule-based matching scales affordably at beachhead stage. Hidden system prompt overhead is minimal (no agentic LLM calls for external content).	Unit economics not yet modelled (Artifact 20 pending). Cost advantage is a function of v1 scope discipline — adding LLM-generated content in v2 changes the margin profile.	Stable in v1. Revisit in Artifact 20 when token budget per agentic action is calculated.

Top 2 moat-building recommendations for the next 90 days

- **Deepen SPP data gravity immediately.** The SPP moat is the only confirmed, strong moat — and it only exists once preferences are populated. XP-3A (self-serve SPP template) and the concierge migration session must ship in Sprint 1. An agency with 0 SPP records is not in the moat yet.
 - **Initiate ACCPA relationship before the first paying customer.** ACCPA endorsement is the NE moat pathway. The moment to initiate is *before* the product launches — when the ask is "would you like early access and a named role in shaping a tool for your members?", not "would you endorse a product you've never seen?" Angela as the entry path has zero cost. Ask at E1 Week 1.
-

7. Positioning Risks

Risk 1 — AlayaCare Fast-Follow (12-Month Window)

Description: AlayaCare ships a trust/preference matching feature — either organically or via acquisition — before Home-Care-AI has established data moat depth or ACCPA endorsement. The primary differentiator ("trust layer AlayaCare doesn't have") becomes a temporary advantage, not a structural one.

Severity: HIGH — this is the single largest strategic risk (Artifact 13 T1).

Mitigation

- SPP data gravity is the defence — not the feature, but the *accumulated data*. AlayaCare can copy the schema; they cannot copy 18 months of an agency's structured preference history.
- ACCPA endorsement creates an industry-level trust anchor that a product feature cannot instantly replicate.
- **Monitoring signal:** Check AlayaCare release notes every 6 weeks (S-1 assumption from Artifact 12). If trust-matching language appears in their product announcements, accelerate ACCPA and standalone adoption immediately — do not wait for the integration path.

Risk 2 — Market Education Burden ("What is a Soft Preference Profile?")

Description: The primary differentiator requires explaining a concept that does not exist in the market yet. "Trust-weighted matching" and "Soft Preference Profile" are not vocabulary coordinators currently use. High education burden slows the sales cycle and increases CAC.

Severity: MEDIUM — manageable with the right messaging approach.

Mitigation

- Lead with the *problem*, not the product concept. Angela's 11 calls and the Arthur Kovacs story need no explanation — every coordinator has a version of both. The SPP is the solution to a problem they already feel, not a new idea they need to adopt.
- Never say "Soft Preference Profile" in external marketing. Say "who the client trusts" or "what the client needs to feel safe." The SPP is the *architecture*; "trust-weighted matching" is the *experience*.
- Objection handlers (§5) are pre-loaded with problem-first language. Sales conversation starts at the pain, not the product.
- **Proof point:** The Moment of Truth validation (Artifact 15 §4) shows that when Angela sees "2 prior visits with Mrs. Kim" on the candidate card, she doesn't need to understand the SPP model. She understands the fact. Familiarity facts, not algorithmic concepts, are the external expression of the SPP moat.

Risk 3 — Coordinator Trust Threshold at First Use

Description: The 1-tap approval value proposition depends on Angela trusting the shortlist enough to act on it without calling. If first-use trust is not established quickly — if coordinators fall back to calling to verify after approving — the OMTM ($\geq 70\%$ 1-tap approvals, no outbound calls) will not be reached, and the value proposition is not confirmed.

Severity: HIGH — this is the hypothesis the entire product depends on (V-1 + V-2 from Artifact 8). The Moment of Truth either validates or kills it.

Mitigation

- The three trust signals at the Moment of Truth are non-negotiable (Artifact 15 §4): (1) "2 prior visits" — a fact, not a score; (2) Qualifications confirmed ✓ — the hard gate ran; (3) Notification preview — no surprises.
 - First-use SPP accuracy is the linchpin. If the SPP is wrong on the first use, Angela's trust is broken for all subsequent uses. Concierge-assisted SPP population (XP-3A) before the product goes live is not optional — it is the trust infrastructure.
 - **Signal to watch:** XP-1B (shadow deviation log). If Angela approves the top candidate but then calls to verify anyway — the product has not yet closed the trust gap. This is the most important behavioural signal in the validation phase.
-

8. Positioning Validation Plan

Before investing in marketing assets, validate the positioning with 5–10 target coordinators.

Validation Question	Method	Target	Timing
Does "right person, every time" resonate as the core promise?	E1 concierge — ask Angela and Tom after first incident: "Did that feel like the right person?"	Both say yes without prompting	E1 Week 1
Does the one-sentence positioning accurately describe what just happened?	Read it to Angela after first use. Ask: "Is that what it felt like?"	Unprompted affirmation or correction	E1 Week 2
Does "trust, not just availability" capture the differentiation in their language?	XP-1C (2 new coordinators, E3 Figma): ask what they would tell a colleague the product does	Coordinator uses trust/familiarity language unprompted	E3 (XP-1C)
Is "SPP" ever the right external term, or always internal only?	Listen to how Angela describes the product to a peer	If she says "it knows who my clients trust", not "soft preference profile", keep SPP internal	E1 Week 3
Does the Agency Owner pitch land?	XP-2A: 3 Agency Owner LOI meetings. Use the agency owner tagline: "Your coordinator's knowledge, in a product that never forgets."	≥ 1 LOI signed	XP-2A (Q2)

9. Handshake Table — HS-STRAT-05 (Positioning → Execution)

ID	From (This Artifact)	To (Execution Plugin)	What Must Transfer
HS-STRAT-05e	§1 Geoffrey Moore statement	create-prd §2 (Problem Statement)	The "who / who / what / unlike" structure becomes the PRD problem statement and the target segment definition. No PRD problem statement that contradicts this positioning is valid.
HS-STRAT-05f	§5 Feature Proof Points	user-stories (Execution Plugin)	Each proof point maps to a user story: "Familiarity flag at Moment of Truth" → Story for ACT-V-07 display; "E-3 gate" → Story for ACT-F-01 with E-3 acceptance criterion; "3-Tap Flow" → Story for ACT-A-01/A-02. Proof points without a user story are positioning claims without a build plan.
HS-STRAT-05g	§6 Moat — SPP data gravity (4/5)	create-prd §7.2 (Priority 1 features)	SPP population flow (ACT-S-01 through ACT-S-03) must be Priority 1 in the PRD — the moat does not exist until the SPP is populated. Concierge migration session is a Day 1 feature, not a v2 feature.
HS-STRAT-05h	§7 Risk 3 — Coordinator trust threshold	agentic-logic -spec	The three Moment of Truth trust signals (familiarity fact, qualifications badge, notification preview) are mandatory UI elements in the logic spec. Their absence is a Requirement Drift defect at harness-audit-grader.

10. Action Items

Due	Owner	Action	Priority
2026-03-28	PM Lead	Validate one-sentence positioning with Angela (CC-001) at E1 Week 1. Read it to her after the first incident. Record exact response.	HIGH
2026-03-28	PM Lead	Confirm "The right person. Every visit." brand promise lands with Tom (CC-002) — ask him what he would want written on the product's homepage. Compare to our brand promise.	HIGH
2026-04-01	Designer	Ensure the 3 Moment of Truth trust signals (familiarity fact, qualifications badge, notification preview) are present in the coordinator approval card (DES-1). These are not design choices — they are positioning-critical elements.	HIGH
2026-04-07	PM Lead	Develop Agency Owner pitch using the "Your coordinator's knowledge, in a product that never forgets" tagline. Test in XP-2A LOI meetings.	HIGH
2026-04-15	PM Lead	Initiate ACCPA relationship (Angela as entry path). Goal: secure advisory board seat or conference submission slot before product launch. See Artifact 18 §4 ACCPA deep dive for entry path.	HIGH
2026-04-15	PM Lead	Once AX-02 (AlayaCare Connect write-back capability) is confirmed by engineer, revisit EMR Integration Lock-in moat score. If bi-directional confirmed: update §6 score from 2/5 to 4/5 and add AlayaCare integration claim to §2 one-sentence positioning for agency owner segment.	MEDIUM

Positioning integrity note: This statement is grounded in confirmed product capabilities and first-party customer evidence. It makes no claims that require a partnership to be true. The SPP moat, the E-3 gate, the trust-weighted match, and the compliance architecture all exist in the product design — independently of any partner relationship. That is intentional. A position that depends on a partner that does not yet exist is a liability, not a strategy. The partner relationships in Artifact 18 amplify this position; they do not create it.
