

Agent2Agent Protocol (A2A) by Google

How A2A Works

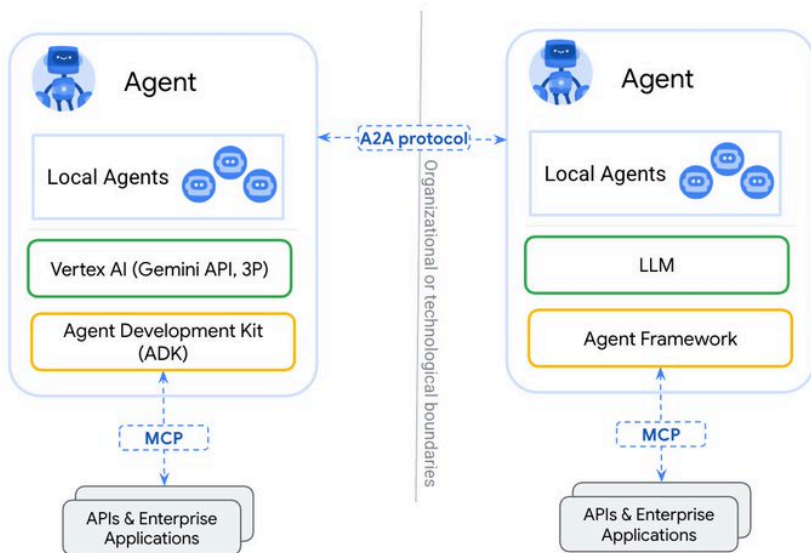

Facilitates 2 agents' communication:

- A **client agent**: formulates tasks
- A **remote agent**: performs those tasks

Regardless of the framework or vendor.

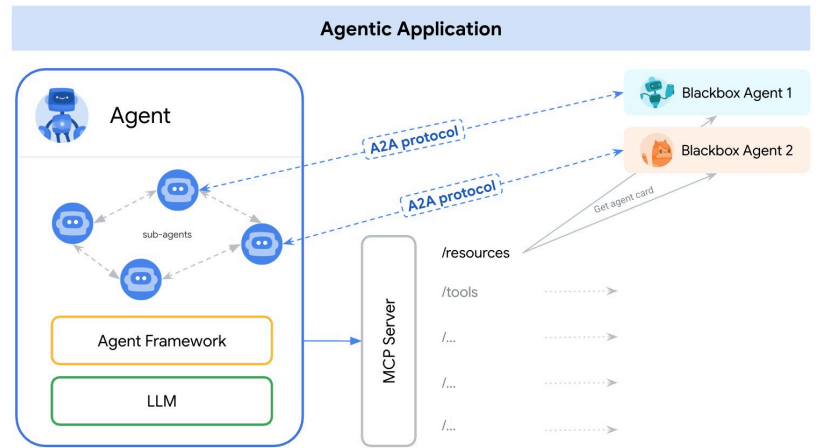

A2A vs MCP (Model Context Protocol)

You can use those standards together:

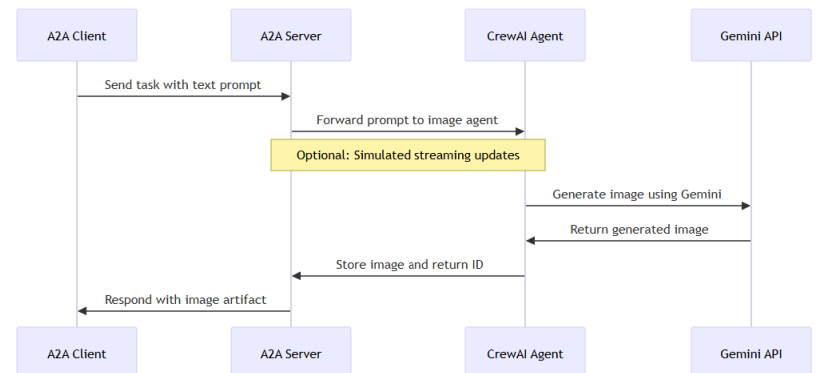

- MCP for sharing tools and resources
- A2A for enabling agent-agent collab

A2A Agent as an MCP resource

Google recommends sharing A2A agents as MCP resources.

Example: CrewAI Agent with A2A

An image generation agent built with CrewAI and exposed through the A2A.
