

What is an AI Product Manager?

Product Manager

[Read the full post](#)

Responsible for	Two key risk areas: Customer value: Do customers want this? Will it create value for them? Business viability: Will it work for different parts of the business?
Key activities	Product Discovery with a cross-functional team (aka “Product Trio”). It results in a validated product backlog. - Ensuring everyone has the context they need to make decisions (strategic context, objectives, discovery). - Communicating with stakeholders and managing expectations.
Needs to succeed	- Strong communication skills. - Understanding the market, customers, and users. - Understanding how the company's business works. Data literacy and data intuition: you can’t fully outsource analytics
Trends	- Participating in shaping strategy (bottom-up). - Driving value for the business. Satisfying customers is not enough. Tech literacy and tech intuition (you do not code, but you should understand what HTML or JSON is when working on a web product).

AI Product Manager

AI PM is a PM who works on AI-powered products or features. On top of core competencies:

+ Needs to succeed	Tech literacy and tech intuition from the AI area. Depending on a product: prompting, fine-tuning, RAG, agents, MCP servers, etc.
+ AI evals	What are AI evals? - Closely related to the Customer value and Business value. - Unlike traditional unit tests, they are non-deterministic. Eval types: Unit tests; Human/model evals; A/B testing. An AI PM, even if supported by others (e.g., Data Analyst), should be: - Looking at the data (LLM traces) Labeling data properly - Performing basic error analysis (many of which are undesired behaviors) - Experimenting with prompts
